- Machine Learning Prediction

Summary of all results

- Exploratory Data Analysis result
- Interactive analytics in screenshots
- Predictive Analytics result

Introduction

Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. This goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

Problems you want to find answers

- What factors determine if the rocket will land successfully?
- The interaction amongst various features that determine the success rate of a successful landing.
- What operating conditions needs to be in place to ensure a successful landing program

Methodology

Executive Summary

- Data collection methodology:
 - Describe how data was collected
- Perform data wrangling
 - Describe how data was processed
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models

Data Collection

The data was collected using various methods

- Data collection was done using get request to the SpaceX API.
- Next, we decoded the response content as a Json using .json() function call and turn it into a pandas dataframe using .json_normalize().
- We then cleaned the data, checked for missing values and fill in missing values where necessary.
- In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
- The objective was to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for future analysis.

Data Collection - SpaceX API

We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.

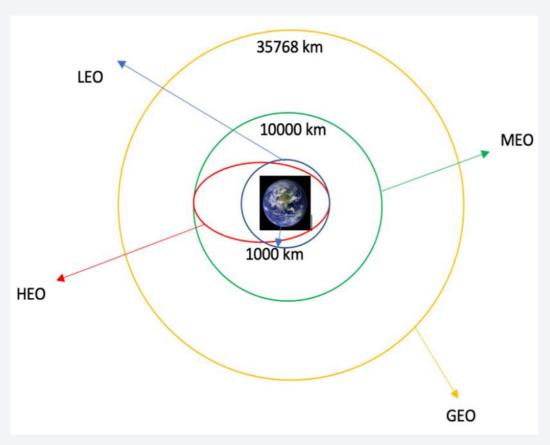

```
1. Get request for rocket launch data using API
       spacex url="https://api.spacexdata.com/v4/launches/past"
       response = requests.get(spacex url)
2. Use json_normalize method to convert json result to dataframe
       # Use json_normalize method to convert the json result into a dataframe
       # decode response content as json
       static_json_df = res.json()
       # apply ison normalize
       data = pd.json_normalize(static_json_df)
3. We then performed data cleaning and filling in the missing values
       rows = data falcon9['PayloadMass'].values.tolist()[0]
       df rows = pd.DataFrame(rows)
       df rows = df rows.replace(np.nan, PayloadMass)
       data_falcon9['PayloadMass'][0] = df_rows.values
       data falcon9
```

Data Collection - Scraping

```
1. Apply HTTP Get method to request the Falcon 9 rocket launch page
in [4]: static_url = "https://en.wikipedia.org/w/index.php?title=List_of_Falcon_9_and_Falcon_Heavy_launches&oldid=1027686922"
In [5]: # use requests.get() method with the provided static_url
          # assign the response to a object
          html_data = requests.get(static_url)
          html data.status code
   2. Create a BeautifulSoup object from the HTML response
In [6]: # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
           soup = BeautifulSoup(html data.text, 'html.parser')
         Print the page title to verify if the BeautifulSoup object was created properly
          # Use soup.title attribute
           soup.title
         <title>List of Falcon 9 and Falcon Heavy launches - Wikipedia</title>
   3. Extract all column names from the HTML table header
In [10]: column_names = []
         # Apply find_all() function with 'th' element on first_launch_table
         # Iterate each th element and apply the provided extract_column_from_header() to get a column name
         # Append the Non-empty column name ('if name is not None and len(name) > 0') into a list called column_names
         element = soup.find_all('th')
         for row in range(len(element)):
                name = extract_column_from_header(element[row])
                if (name is not None and len(name) > 0):
                    column names.append(name)
             except:
                pass
    4. Create a dataframe by parsing the launch HTML tables
    Export data to csv
```

- We applied web scrapping to webscrap Falcon9 launch records with BeautifulSoup
- We parsed the table and converted it into a pandas dataframe.

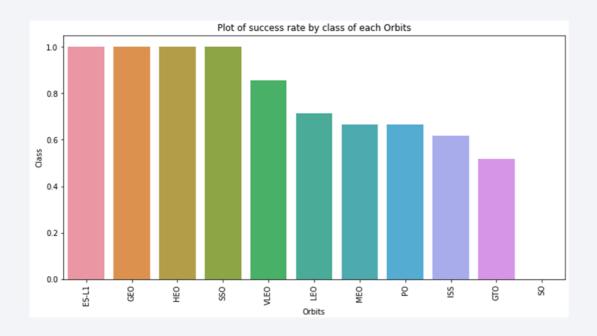

Data Wrangling

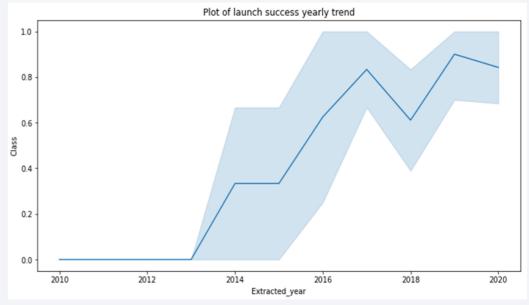

- Describe how data were processed
- You need to present your data wrangling process using key phrases and flowcharts
- Add the GitHub URL of your completed data wrangling related notebooks, as an external reference and peer-review purpose

EDA with Data Visualization

We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly.

EDA with **SQL**

- -We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- -We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
 - The names of unique launch sites in the space mission.
 - The total payload mass carried by boosters launched by NASA (CRS)
 - The average payload mass carried by booster version F9 v1.1
 - The total number of successful and failure mission outcomes
 - The failed landing outcomes in drone ship, their booster version and launch site names.

Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
 - Are launch sites near railways, highways and coastlines.
 - Do launch sites keep certain distance away from cities.

Build a Dashboard with Plotly Dash

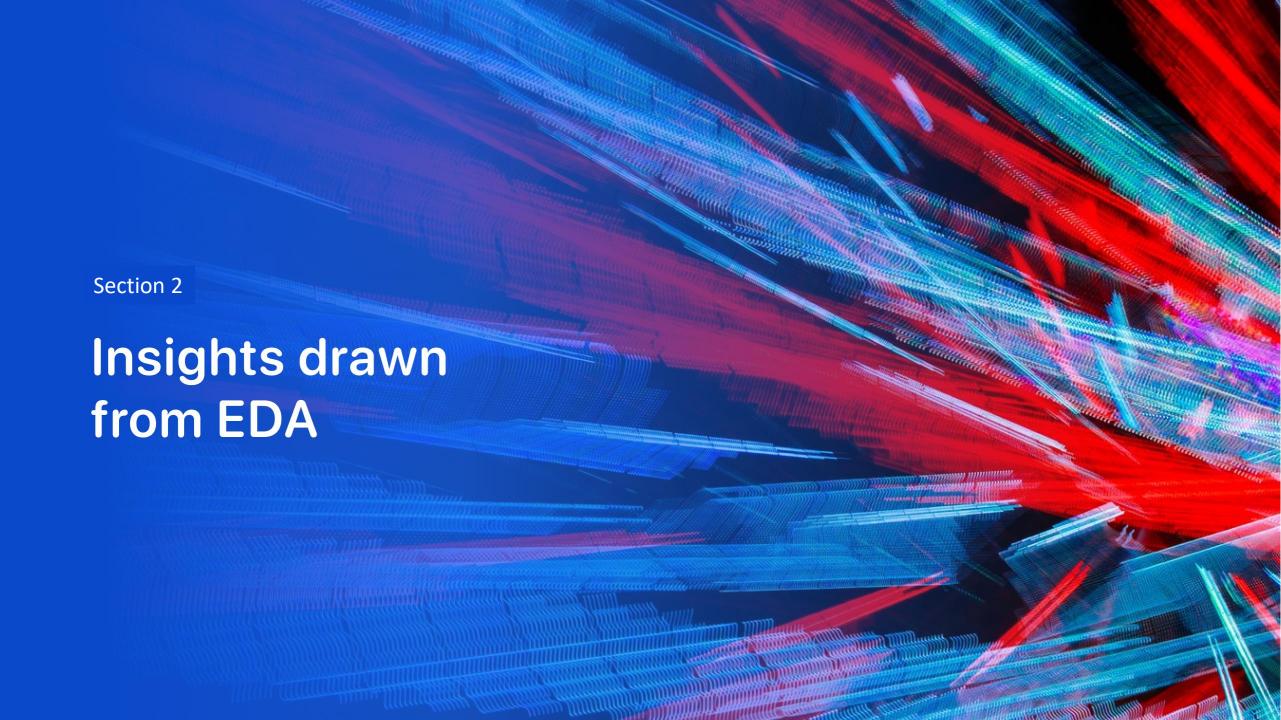

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.

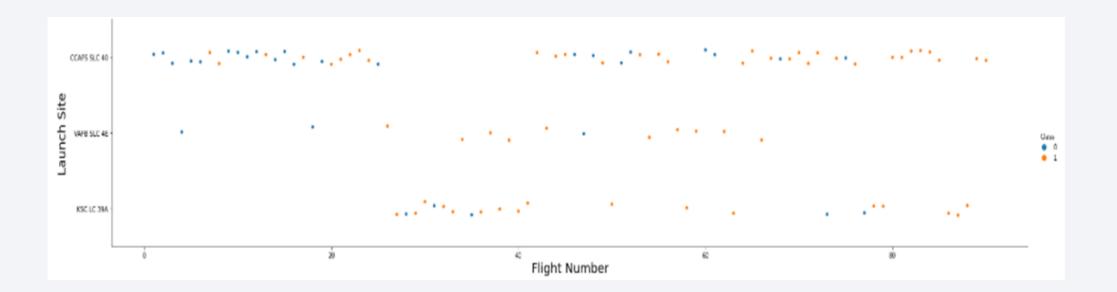

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

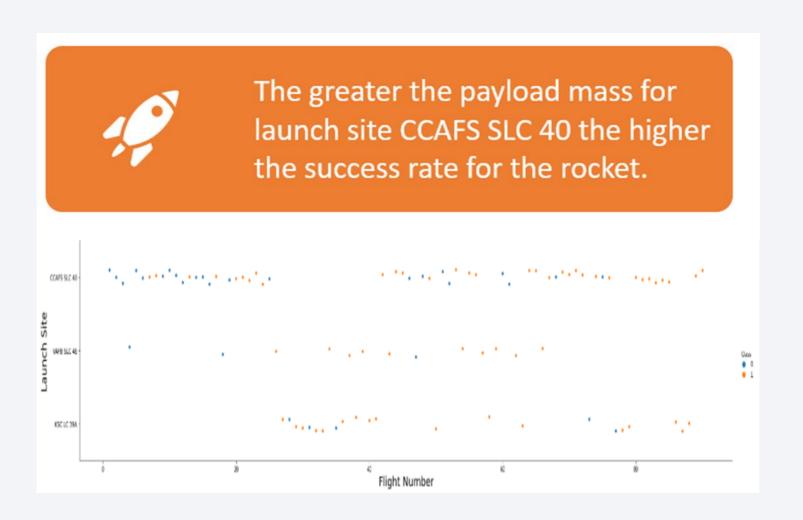

Flight Number vs. Launch Site

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

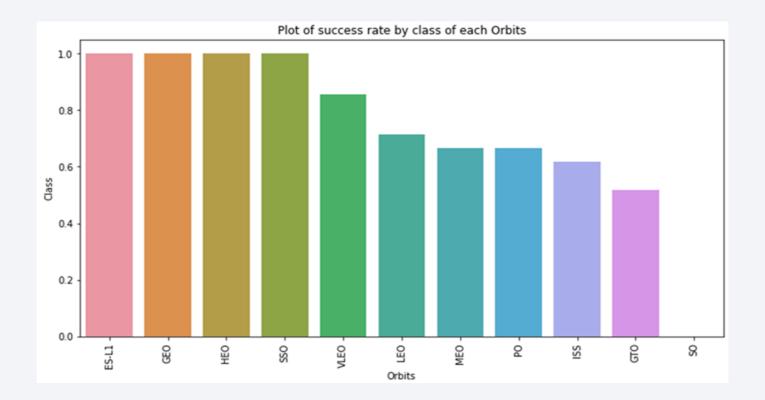

Payload vs. Launch Site

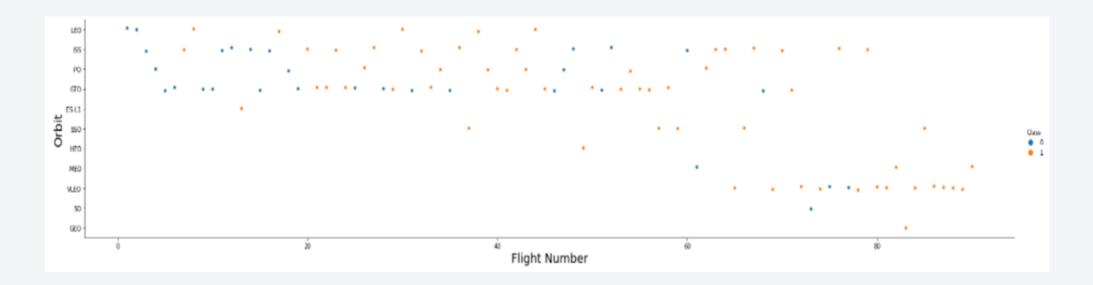

Success Rate vs. Orbit Type

From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

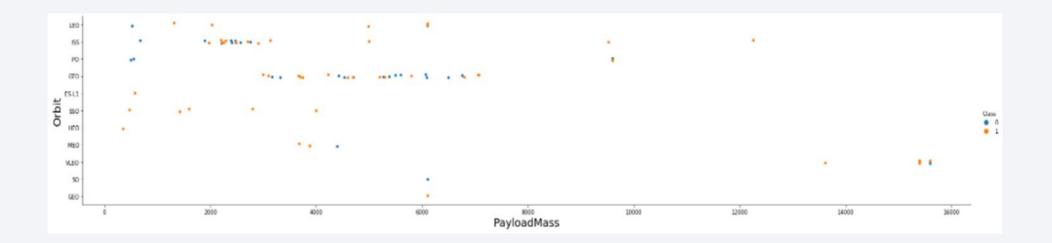

Flight Number vs. Orbit Type

The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

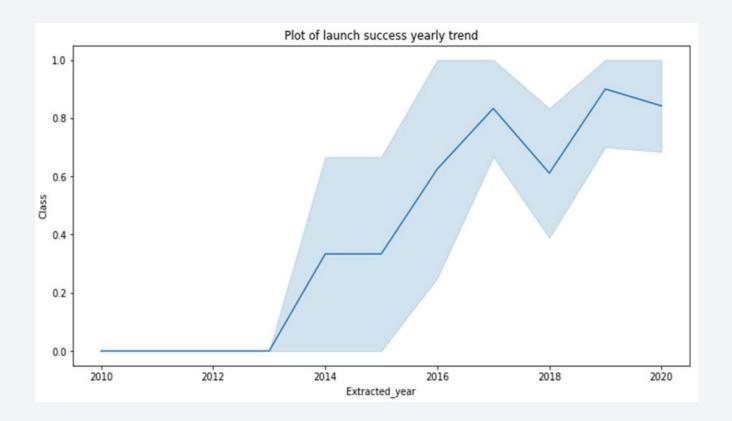

Payload vs. Orbit Type

We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

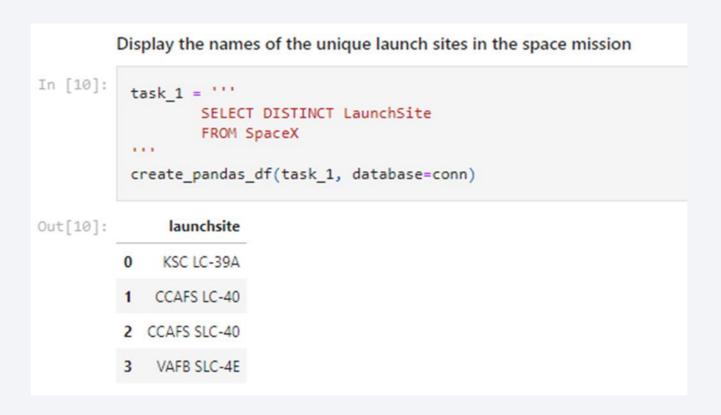

Launch Success Yearly Trend

From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

All Launch Site Names

We used the key word **DISTINCT** to show only unique launch sites from the SpaceX data.

Launch Site Names Begin with 'CCA'

We used the query above to display 5 records where launch sites begin with `CCA`

| [11]: | <pre>task_2 = ''' SELECT * FROM SpaceX WHERE LaunchSite LIKE 'CCA%' LIMIT 5 ''' create_pandas_df(task_2, database=conn)</pre> | | | | | | | | | | |
|-------|---|----------------|----------|----------------|-----------------|--|---------------|--------------|--------------------|----------------|------------------------|
| 11]: | | date | time | boosterversion | launchsite | payload | payloadmasskg | orbit | customer | missionoutcome | landingoutcome |
| | 0 | 2010-04- 06 | 18:45:00 | F9 v1.0 B0003 | CCAFS LC- 40 | Dragon Spacecraft Qualification Unit | 0 | LEO | SpaceX | Success | Failure (parachute) |
| | 1 | 2010-08- 12 | 15:43:00 | F9 v1.0 B0004 | CCAFS LC- 40 | Dragon demo flight C1, two CubeSats, barrel of | 0 | LEO (ISS) | NASA (COTS) NRO | Success | Failure (parachute) |
| | | | | | CCAFCIC | | | 150 | | | |
| | 2 | 2012-05- | 07:44:00 | F9 v1.0 B0005 | CCAFS LC- 40 | Dragon demo flight C2 | 525 | (ISS) | NASA (COTS) | Success | No attempt |
| | 3 | | 07:44:00 | F9 v1.0 B0005 | | Dragon demo flight C2 SpaceX CRS-1 | 525 500 | | NASA (COTS) | Success | No attempt |

Total Payload Mass

We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)

In [12]:

task_3 = '''

SELECT SUM(PayloadMassKG) AS Total_PayloadMass
FROM SpaceX
WHERE Customer LIKE 'NASA (CRS)'

""

create_pandas_df(task_3, database=conn)

Out[12]:

total_payloadmass

0 45596
```

Average Payload Mass by F9 v1.1

We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

```
Display average payload mass carried by booster version F9 v1.1

In [13]:

task_4 = '''

SELECT AVG(PayloadMassKG) AS Avg_PayloadMass
FROM SpaceX
WHERE BoosterVersion = 'F9 v1.1'

""

create_pandas_df(task_4, database=conn)

Out[13]:

avg_payloadmass

0 2928.4
```

First Successful Ground Landing Date

We observed that the dates of the first successful landing outcome on ground pad was 22nd December 2015

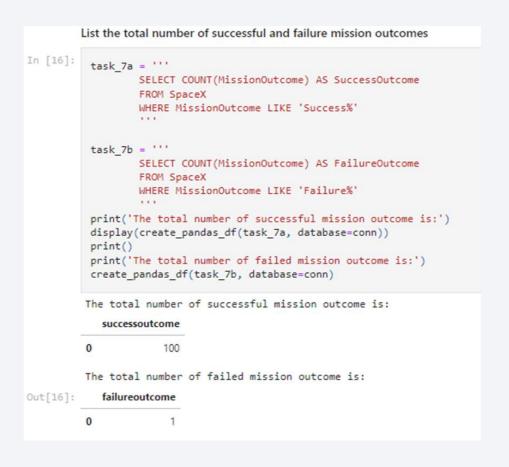

Successful Drone Ship Landing with Payload between 4000 and 6000

We used the **WHERE** clause to filter for boosters which have successfully landed on drone ship and applied the **AND** condition to determine successful landing with payload mass greater than 4000 but less than 6000

Total Number of Successful and Failure Mission Outcomes

• We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

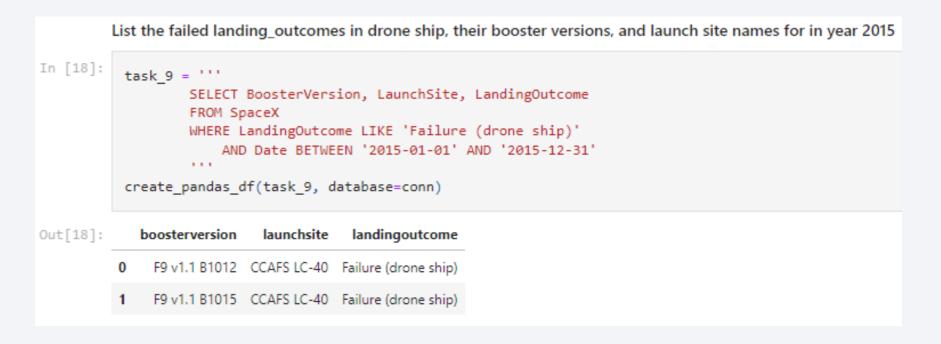

Boosters Carried Maximum Payload

```
List the names of the booster_versions which have carried the maximum payload mass. Use a subquery
 task 8 = '''
         SELECT BoosterVersion, PayloadMassKG
         FROM SpaceX
          WHERE PayloadMassKG = (
                                   SELECT MAX(PayloadMassKG)
                                   FROM SpaceX
          ORDER BY BoosterVersion
 create_pandas_df(task_8, database=conn)
    boosterversion payloadmasskg
 F9 B5 B1048.4
                          15600
 1 F9 B5 B1048.5
                          15600
    F9 B5 B1049.4
                          15600
     F9 B5 B1049.5
                          15600
 4 F9 B5 B1049.7
                          15600
 5 F9 B5 B1051.3
                          15600
 6 F9 B5 B1051.4
                          15600
 7 F9 B5 B1051.6
                          15600
    F9 B5 B1056.4
                          15600
    F9 B5 B1058.3
                          15600
10 F9 B5 B1060.2
                          15600
11 F9 B5 B1060.3
                          15600
```

We determined the booster that have carried the maximum payload using a subquery in the **WHERE** clause and the **MAX()** function.

2015 Launch Records

We used a combinations of the **WHERE** clause, **LIKE**, **AND**, and **BETWEEN** conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

We selected Landing outcomes and the **COUNT** of landing outcomes from the data and used the **WHERE** clause to filter for landing outcomes **BETWEEN** 2010-06-04 to 2010-03-20.

We applied the **GROUP BY** clause to group the landing outcomes and the **ORDER BY** clause to order the grouped landing outcome in descending order.

```
Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))
 task 10 = '''
          SELECT LandingOutcome, COUNT(LandingOutcome)
          FROM SpaceX
          WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
          GROUP BY LandingOutcome
          ORDER BY COUNT(LandingOutcome) DESC
 create pandas df(task 10, database=conn)
       landingoutcome count
            No attempt
     Success (drone ship)
      Failure (drone ship)
    Success (ground pad)
      Controlled (ocean)
   Uncontrolled (ocean)
6 Precluded (drone ship)
      Failure (parachute)
```

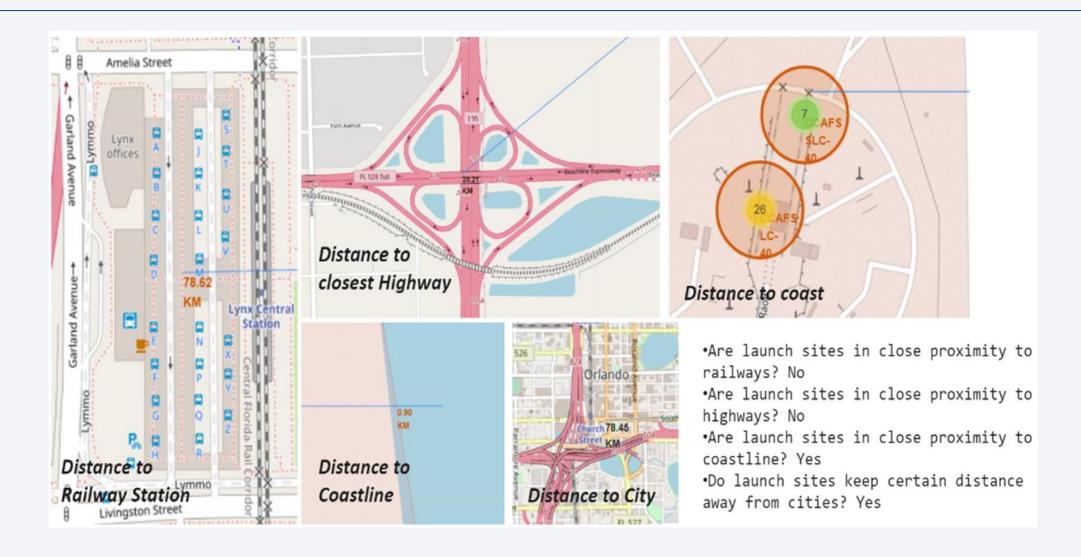

All launch sites global map markers

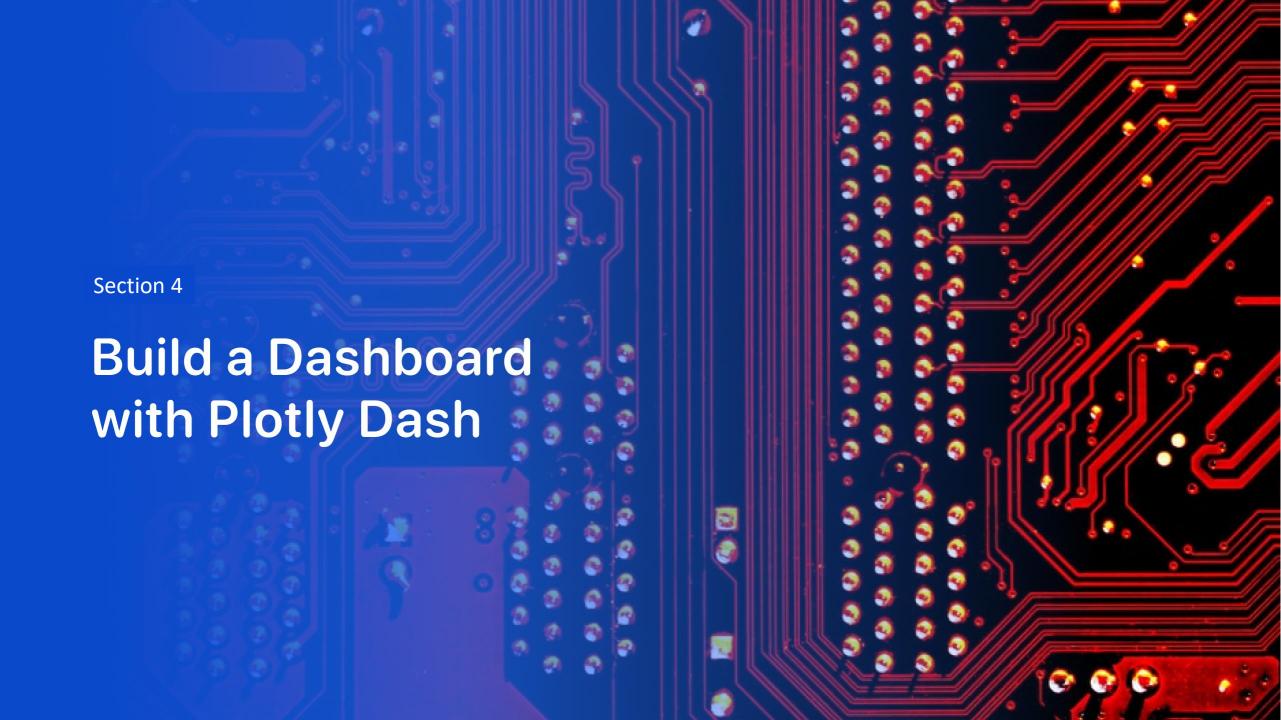

Markers showing launch sites with color labels

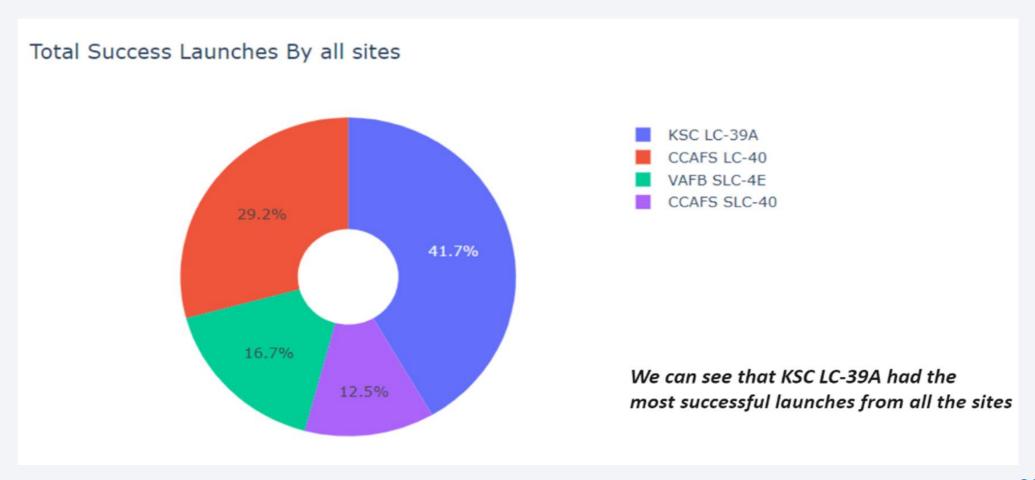

Launch Site distance to landmarks

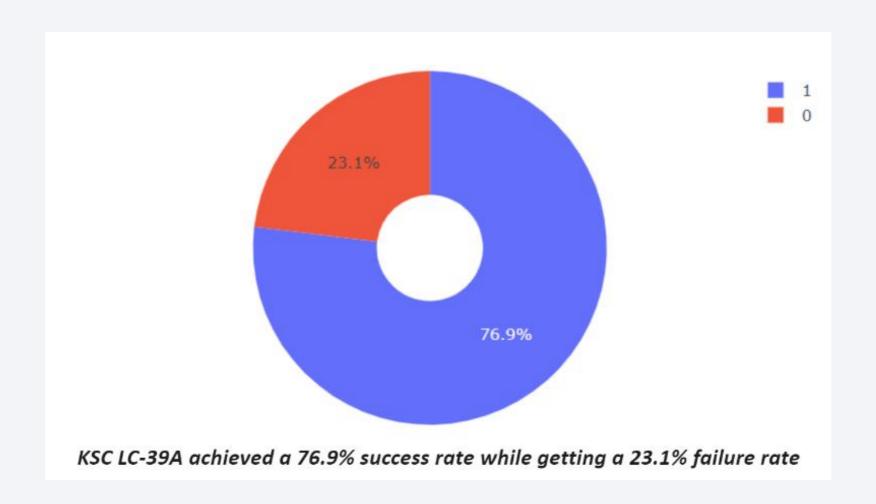

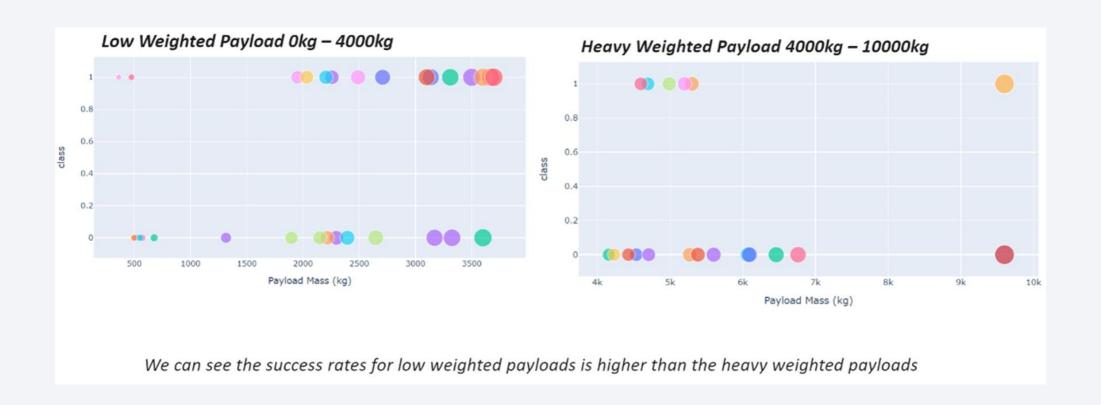

Pie chart showing the success percentage achieved by each launch site

Pie chart showing the Launch site with the highest launch success ratio

Scatter plot of Payload vs Launch Outcome for all sites, with different payloadselected in the range slider

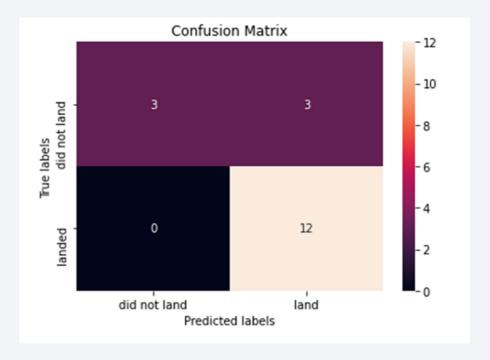

Classification Accuracy

The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn_cv.best_score_,
               'DecisionTree':tree cv.best score ,
               'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm cv.best score }
bestalgorithm = max(models, key=models.get)
print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree cv.best params )
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn cv.best params )
if bestalgorithm == 'LogisticRegression':
     print('Best params is :', logreg_cv.best_params_)
if bestalgorithm == 'SupportVector':
    print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}
```

Confusion Matrix

The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- 1. The larger the flight amount at a launch site, the greater the success rate at a launch site.
- 2. Launch success rate started to increase in 2013 till 2020.
- 3. Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- 4. KSC LC-39A had the most successful launches of any sites.
- 5. The Decision tree classifier is the best machine learning algorithm for this task.
